I. Where do the color palettes come from?

`@prism` includes some original creations, but most color palettes are derived from the projects listed below.

- `Asymptote` is used, but currently offers nothing beyond `Matplotlib` (despite different implementations).
- `CarbonPlan` provides palettes designed for data visualization..
- `CARTOColors` palettes are extracted from `Palettable` project.
- `CMasher` provides palettes designed for data visualization..
- `cmocean` palettes are extracted from `Palettable` project.
- `Colorbrewer` provides professional color palettes for mapping and data visualization.
- `Light and Bartlein` palettes are extracted from `Palettable` project.
- `Matplotlib` compiles color maps from diverse projects.
- `MyCarta` palettes are extracted from `Palettable` project.
- `Plotly` palettes are extracted from `Palettable` project.
- `Scientific Coulour Maps` provides palettes designed for colorblind accessibility.
- `Tableau` palettes are extracted from `Palettable` project.
- `Wes Anderson Palettes` palettes are extracted from `Palettable` project.

We retain only palettes that comply with the following rules.

- **No repetition.** Unlike `Matplotlib`,[1] `@prism` use a one-to-one map from names to palettes.[2]
- **No reversed versions.** Unlike `Matplotlib`,[3] `@prism` never includes reversed palettes as fixed data.
- **No shifted versions.** Unlike `Colormaps`,[4] `@prism` never includes shifted palettes as fixed data (most implementations offer an API that enables this and other transformations through configurable parameters).
- **Reasonable palette sizes.** Palettes with more than 512 colors are ignored (e.g., `CMasher` proposes 'neutral' palette, which consists of 2560 colors). This avoids potential issues with certain technologies, such as LaTeX, and frankly, offers a level of precision that is far beyond the needs of us mere mortals — or at least, those of us who aren't astronomers.

Note.

Adding new palettes to `@prism` is straightforward (no coding skills required). See section ?? to get started.

[1] Some `Matplotlib` palettes are duplicated, likely for historical reasons.
[2] This does not preclude the existence of palettes with different names that are visually similar, or even looks identical. This is often justified by the number of colors used; a higher color depth helps prevent artifacts when generating high-resolution graphics.
[3] Most `Matplotlib` color maps have a reversed version named with the `_r` suffix, possibly for performance reasons.
[4] These palettes use an integer suffix directly following the original palette name.
