Appendix 1 – Ignored palettes

Important.

The palette names in this appendix are standard, but some `@prism` implementations add a specific prefix.

Excluded by design

The following palettes have been intentionally excluded. Please refer to the explanation below.

Table 1: Excluded palettes

CMasher	`Neutral`	Too big (size > 512).
	`Savanna`	Looks completely black.

Unkept palettes

The following types of palettes are unkept.

- **Exact duplicates:** identical color arrays.
- **Visual identical:** those indistinguishable to the naked eye.[1]
- **Transformations:** reversals, shifts, or a combination of both.

We identify relations between palettes using the following notations.

Duplicates	Visually identical	Reversal	Reversal and shifted
$=$	$\cong$	$\rightleftharpoons$	$\rightleftharpoons$

We list the unkept palettes below, omitting duplicates that share both name and colors. The rightmost palettes are those retained in `@prism`. For instance, the table shows that `Matplotlib`'s `Gray` is the reversal of `@prism`'s `Binary`.

Table 2: Unkept palettes

Matplotlib	`Cubehelix`	$\cong$	`Classic`
	`TwilightShifted`	$\rightleftharpoons$	`Twilight`
	`Gray`	$\rightleftharpoons$	`Binary`
	`GistYarg`	$\rightleftharpoons$	`GistGray`
Plotly	`D3`	$=$	`Tab10`
Tableau	`Tableau`	$=$	`Tab20`

Reconstructing unkept shifted palettes

Let's detail how to retrieve only those excluded palettes from `@prism` that required a shift.

Table 3: Unkept palettes

Matplotlib	`TwilightShifted`	`used_palette = Twilight`
		`reverse = True`
		`shift = 256`

[1] In these cases, the original palette is retained. For instance, as `Matplotlib`'s `Cubehelix` is a specific implementation of the original `Cubehelix`'s `Classic`, we keep the latter.
