Appendix 2 – Palettes by category

Warning.

The palette names in this appendix are standard, but some `@prism` implementations add a specific prefix.

Note (Qualitative and semantic palettes).

The threshold of 40 colors has been established for qualitative and semantic palettes. The following lines outline the rationale for this limit.

- *In qualitative color palettes, each color represents a single data point or a group of data. Experience shows that about ten colors are more than enough.*
- *Semantic palettes associate a color with a specific context, such as warning levels (see the three frames in this document). Choosing 40 colors allows for 10 different contexts, each with 4 sub-categories. Here are some examples of sub-categories.*

  10-19 ***Initial / Idle:*** *default states such as "To Do", "Clickable", or "To be analyzed".*
  20-29 ***Active / Transition:*** *states in flux, including "In Progress" or UI "Hover" effects.*
  30-39 ***Success / Final:*** *terminal positive states like "Done", "Clicked", or "Validated".*
  40-49 ***Alert / Rejection:*** *error handling and negative outcomes, e.g., "Error", "Inactive", or "Rejected".*

Important.

Categories were generated semi-automatically, followed by manual selection to obta in relevant choices.

Colorblind palettes

Colorblind palettes provide high-contrast hues specifically optimized for users with color vision deficiency.

Cyclic palettes

Cyclic palettes create seamless loops for periodic data, such as angles, seasons, or 24-hour cycles.

Qualitative palettes

Qualitative palettes use distinct hues to separate categorical data without implying any order or hierarchy.

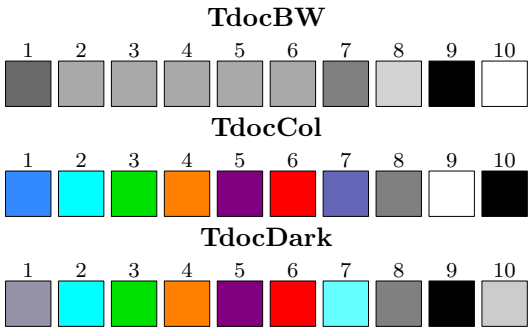
Semantic palettes

Semantic palettes assign colors to categories — such as UI states, system status, or pedagogical elements — to convey immediate meaning.



Sequential palettes

Sequential palettes represent ordered data using a single or multi-hue gradient with increasing lightness.
