

@prism project

«AUTHOR»

«DATE-N-VERSION»

The @prism project¹ provides small size color palettes that can be used to create expressive color maps for graphics in different contexts.

¹The name comes from “*@ · esthetic P · roducts for R · epresenting I · nformative S · cientific M · aps*”. This name is a double play on words: [1] a prism is where light is split into an informative spectrum, symbolizing how data or visuals are decomposed into meaningful color and style, and [2] where light meets the prism, it breaks down into an informative spectrum (“@” can be read “at”).
